

Mapping of land covers in South Greenland using very high resolution satellite imagery

Menaka Chellasamy, Mateja Ogric, Mogens H. Greve and René Larsen

Outline: Introduction - Data used - Methods - Results

THE

GLOBAL WARMING

Climbing temperatures.
Melting glaciers. Rising seas.
All over the earth we're feeling the heat.

‘Arctic warming , a boon’

Greenland

'Arctic warming, a boon'

Arctic to sub-arctic

8 to 12°C increment

ipcc

INTERGOVERNMENTAL PANEL ON
climate change

Agriculture in young soil

A satellite map of the Arctic region, showing the Arctic Ocean and surrounding landmasses including North America, Europe, and Asia. The map is overlaid with a semi-transparent dark blue rectangle containing text.

Research interests

- ▶ Substantial reservoir of Soil Organic Carbon (SOC)
- ▶ Potential areas for agriculture and animal farming
- ▶ Significant influence of carbon on the global C - cycle

Study area

- ▶ Upernaviarssuk, 17,500 km²
- ▶ Focus on top soil, down to 25 cm depth
- ▶ Land cover map for SOC upscaling

Land cover classes

Shrubs

Lichens

Grass

Rock/ Stones

Water

Shallow water

Shadow

Soil

Sand

Road

Sampling

- ▶ 780 land cover samples
- ▶ Cluster sampling

Object-based supervised classification method

Comparison: 4 traditional band vs 8 bands

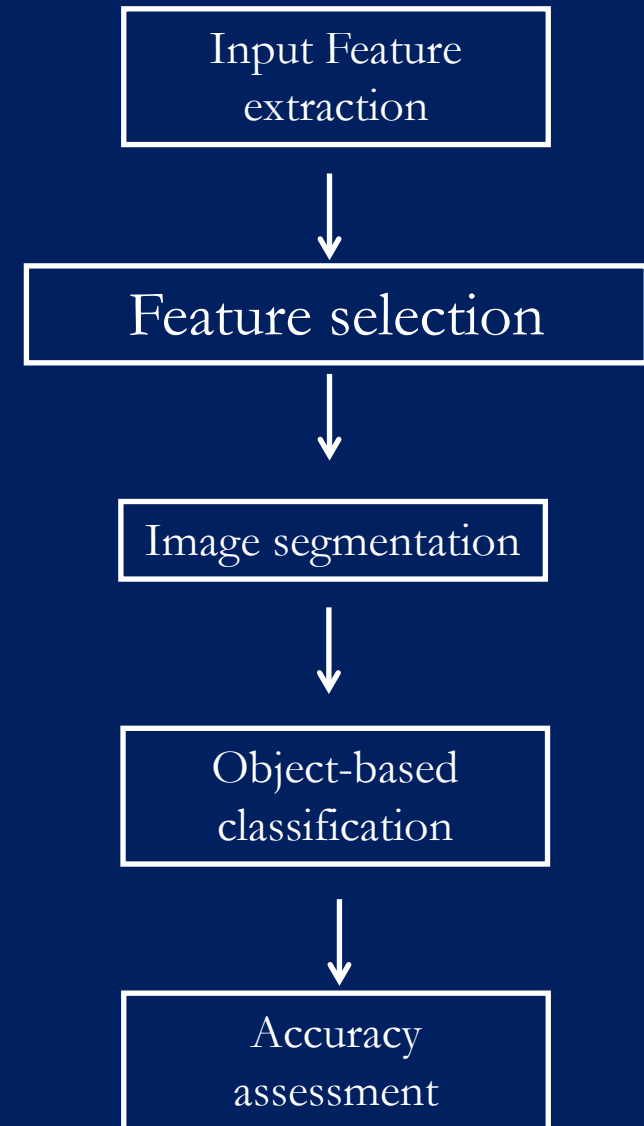

Object-based supervised classification method

- ▶ 215 from 4 bands / 392 from 8 bands, Matlab R2016a
- ▶ Spectral reflectances from each band
- ▶ Gabor texture from each band (5 frequencies and 8 orientations)
- ▶ Gabor texture from 1st principal component from spectral bands
- ▶ Spectral indices (water, soil, pigment, yellowness, biomass)

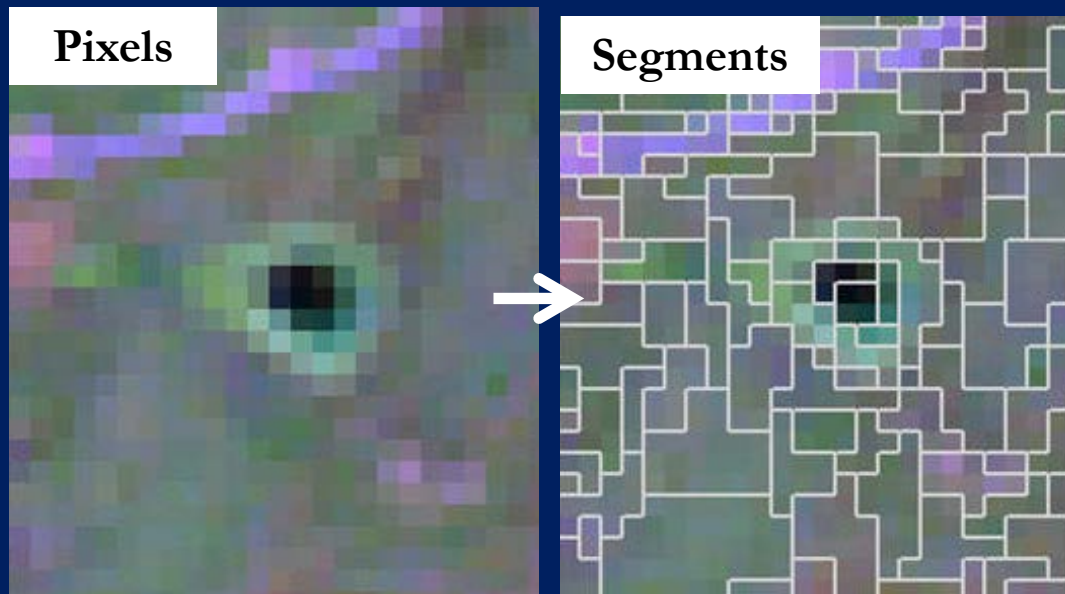

Object-based supervised classification method

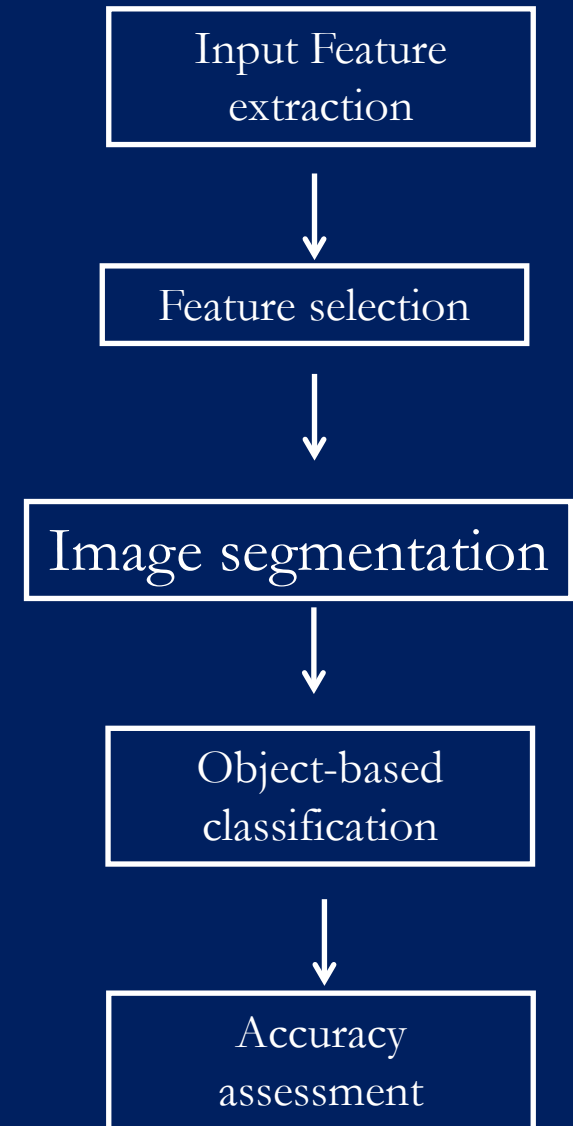

- ▶ Weka system (Novack et al, 2011)
 - ▶ Random Forest (RF)
 - ▶ Fast Correlation-Based Filter (FCBF),
 - ▶ InfoGain (IG)
 - ▶ Relief-F (Re-F).
-
- ▶ 5 most relevant features from each algorithm are selected
-
- ▶ 12 for 4 band / 18 for 8 band

Object-based supervised classification method

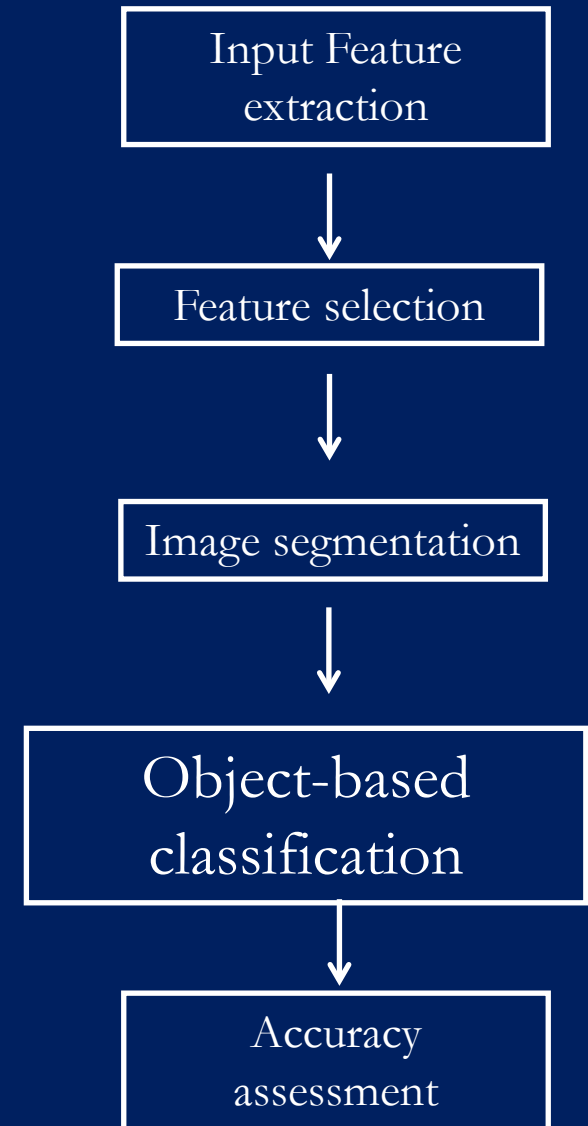

- ▶ Multi-resolution segmentation, eCognition 9.1
- ▶ Scale 30, 50, 70, 100
- ▶ compactness: 0.5, smoothness: 0.5, color: 0.9 and shape: 0.1

Object-based supervised classification method

- ▶ 448 training image objects, Matlab R2016a
- ▶ 70 as base scale for classification
- ▶ mean; standard deviation; mean difference to neighbors; mean difference to scene; mean and standard deviation difference to super and sub objects;
- ▶ Support vector machine: radial basis function.

Object-based supervised classification method

- ▶ 224 image objects for validation, Matlab R2016a
- ▶ Overall classification accuracy (OA), user and producer accuracy, 95% confidence level
- ▶ Uncertainty analysis based on prediction probability (Cohen 1985)

Segmentation results, Scale 70

4 traditional bands

8 bands

Classification results, Scale 70

Segmented
image

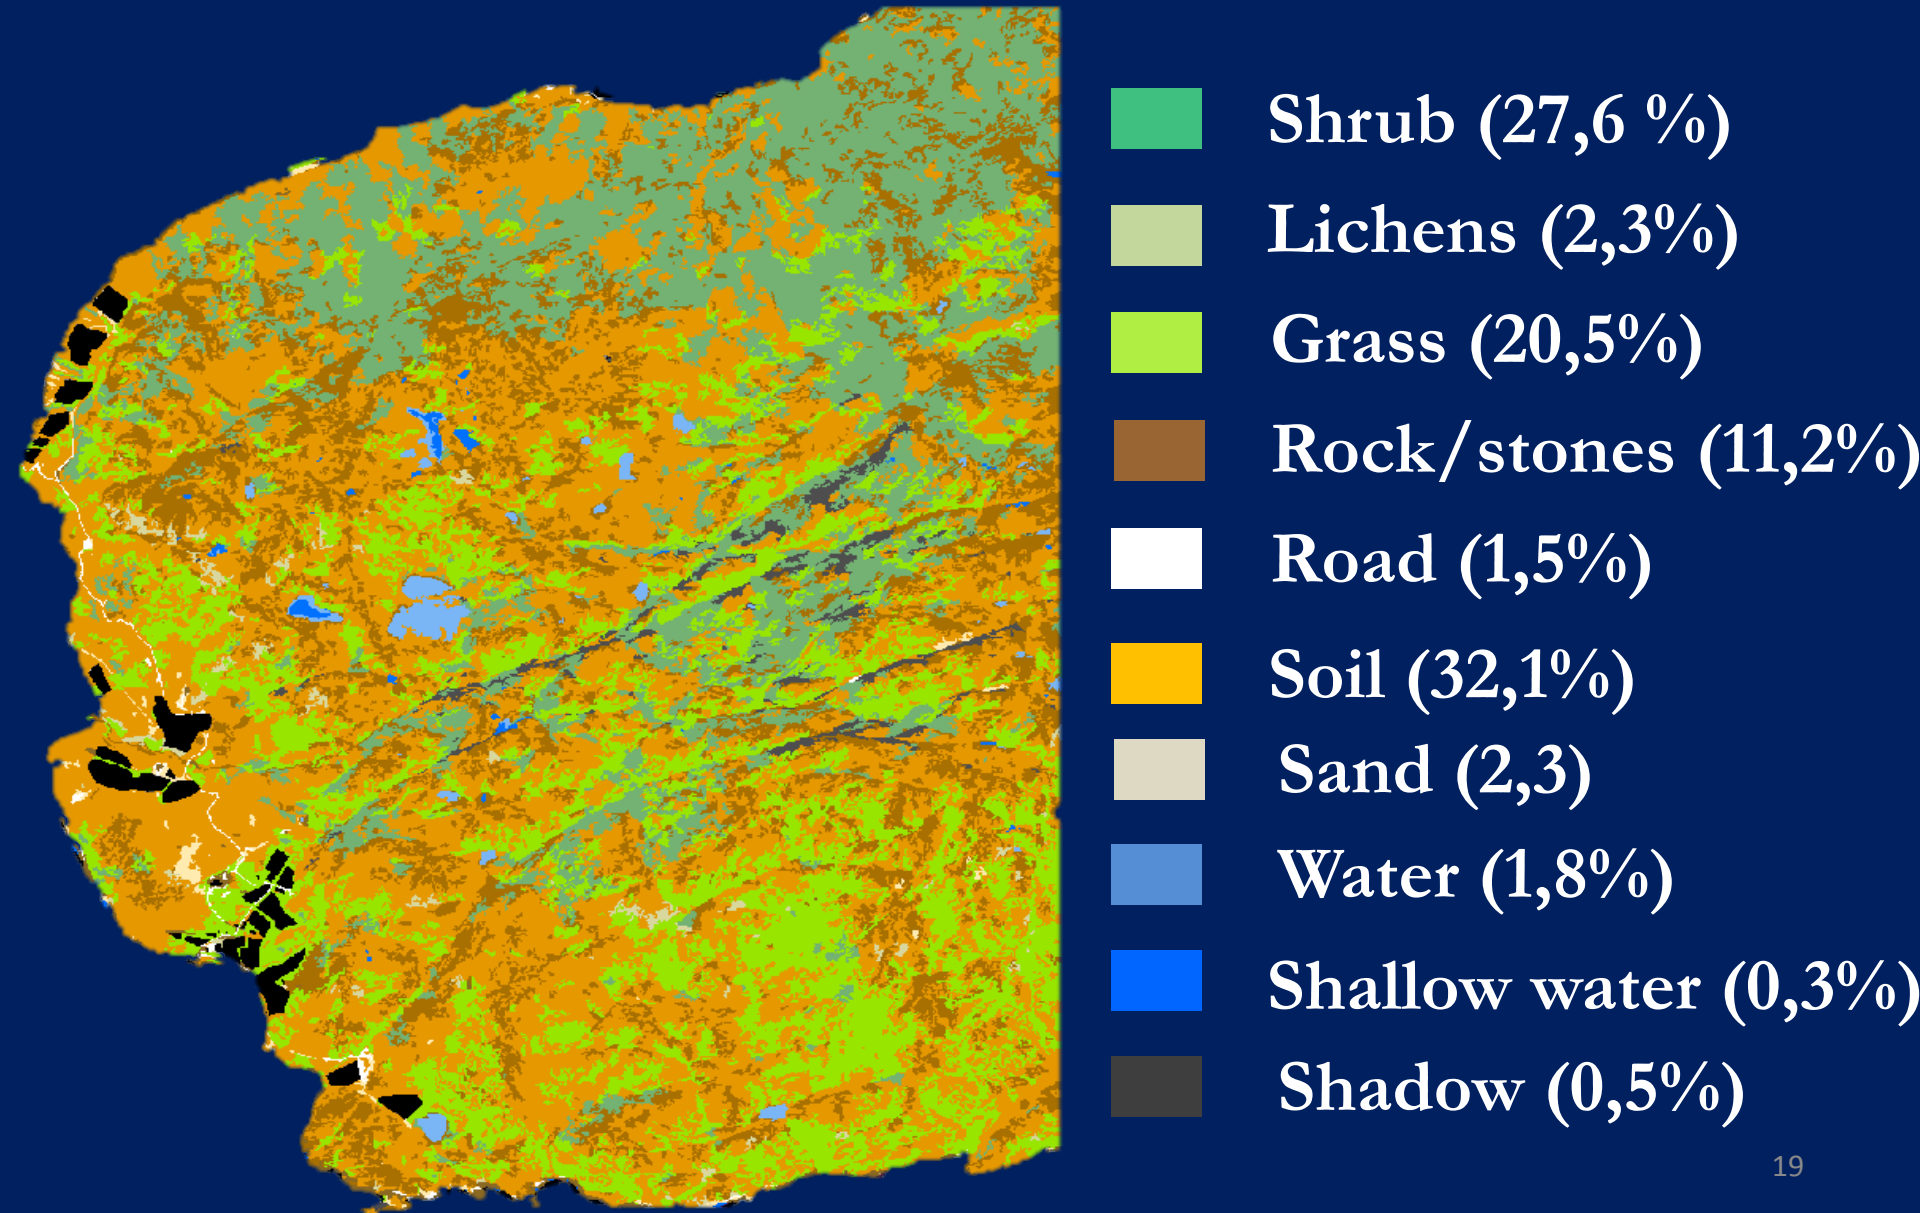

-  Shrub
-  Lichens
-  Grass
-  Rock/stones
-  Road
-  Soil
-  Sand
-  Water
-  Shallow water
-  Shadow

4 traditional bands

8 bands

Classification results, Scale 70

Classification accuracy

Overall classification accuracy:

4 traditional bands 82.5%

8 bands 89.3%

Producer accuracy (%)

Uncertainty (%)

8 band

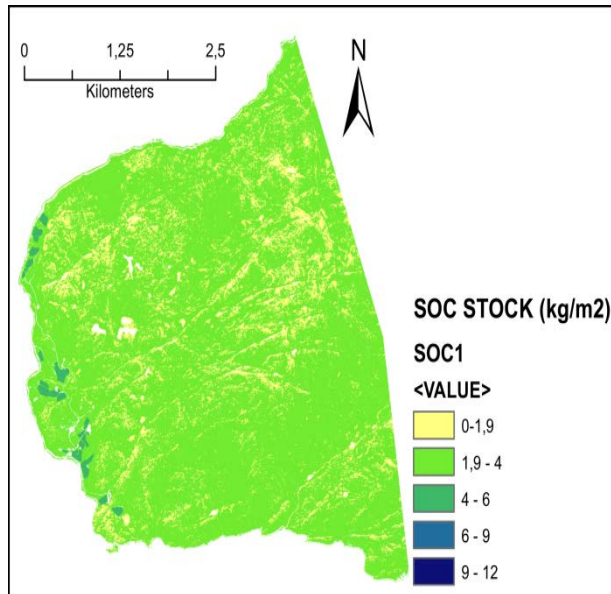

4 band

Thank you

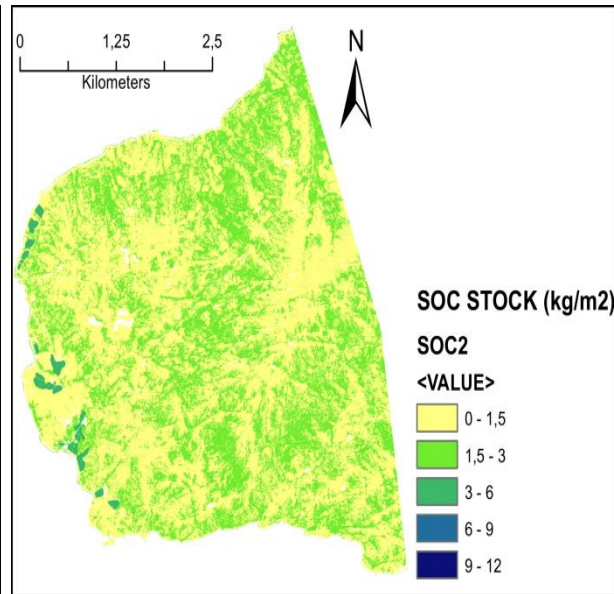

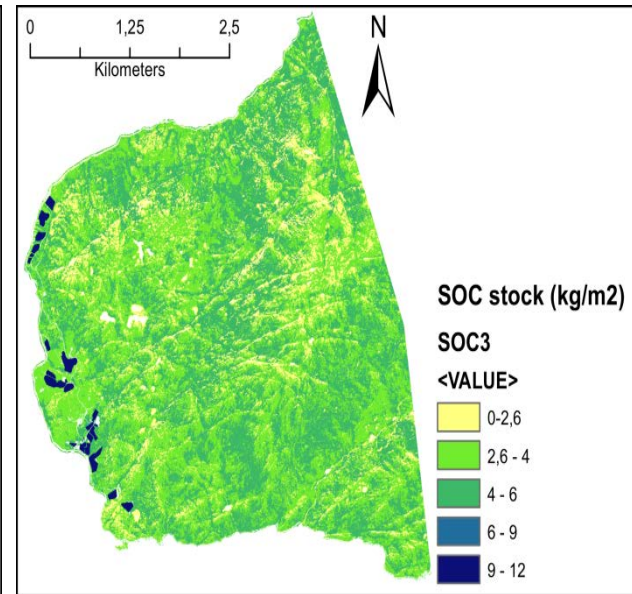

SOC stock maps

SOC stock for depth 0 – 5 cm
RMSE = 0,94 kg/m²

SOC stock for depth 5 – 15 cm
RMSE = 0,82 kg/m²

SOC stock for depth 0 - 15 cm
RMSE = 1,12 kg/m²

Evidence and Impact of Arctic Warming

- Sea ice – thinning (>40%) and shrinking (11.5% / decade)**
- Permafrost melting – also releases methane**
- Land ice melting – sea level change**
- Loss of sea ice – impacts habitat of polar bears, walruses**
- Ecosystem shifts – from Arctic to subarctic communities**
- Increase human activities – shipping and oil production**

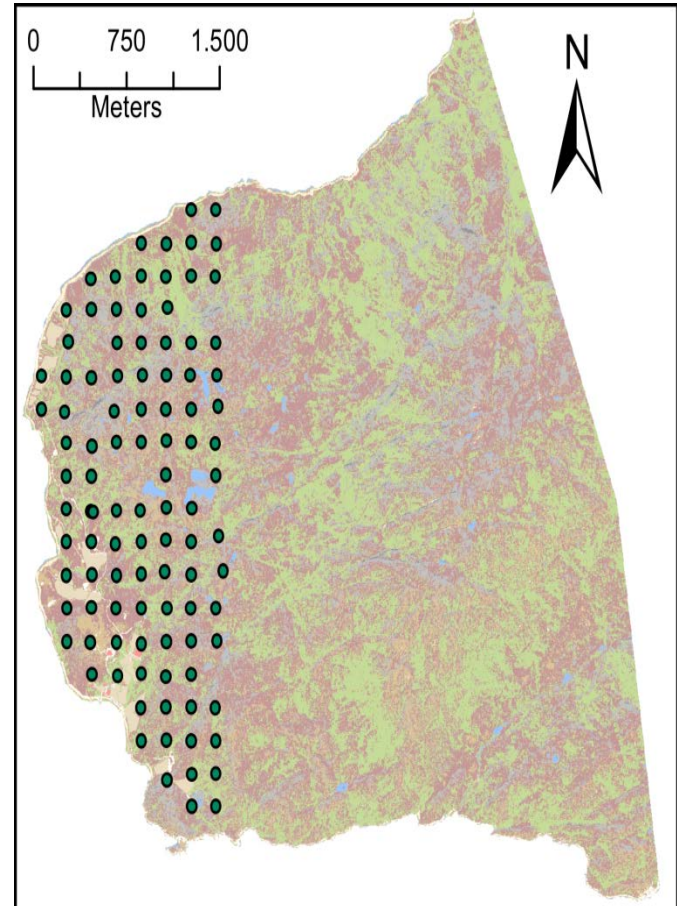

SOC STOCK CALCULATIONS

$$\text{SOC stock} = C \times \text{bulk density} \times \text{sampling depth} \times (1 - CF)$$

- SOC stock (kg/m³)
- Measured C (%)
- Bulk density (kg/m²)
- Sampling depth (m)
- CF... coarse fractions (%)

dataset

-
- 233 soil samples
 - Two reference depths: 0 – 5 cm, 5 – 15 cm
 - Grid sampling: 200 m

Table

Image layers/ features calculated from all 8 bands of WV2

Dataset 2: WV2 (8 bands), 392 features		
Feature name	Description	Dimension
Bands 1-8	Spectral reflectance from all 8 bands	8
SDB 1-8	Standard deviations of individual bands 1-8	8
Bright	Brightness, average of means of bands 1-8	1
Ratio 1-8	Individual band mean divided by sum of means of bands 1-8	8
NDVI1	$(\text{band7} - \text{band5}) / (\text{band7} + \text{band5})$	1
NDVI2	$(\text{band8} - \text{band6}) / (\text{band8} + \text{band6})$	1
Yellow NDVI	$(\text{band8} - \text{band4}) / (\text{band8} + \text{band4})$	1
NDWI	$(\text{band3} - \text{band8}) / (\text{band3} + \text{band8})$	1
NIR NDVI	$(\text{band8} - \text{band7}) / (\text{band8} + \text{band7})$	1
NPCI	$(\text{band5} - \text{band1}) / (\text{band5} + \text{band1})$	1
NDSI	$(\text{band3} - \text{band4}) / (\text{band3} + \text{band4})$	1
Spectral-texture	Gabor texture features extracted from individual bands 1-8 at different 5 radial frequencies (γ) and 8 orientations (θ)	320
PC texture	Gabor texture features extracted from first principal components of bands 1-8 at different 5 radial frequencies (γ) and 8 orientations (θ)	40

NPCI – Normalized Pigment Chlorophyll index; NDSI – Normalized difference soil index;
