

# Microbial Futures

The biosocial lives of small things

21-22 May 2024

Symposium

Venue: AIAS

The symposium explores the intricate web of connections between microscopic presences and humans and animals.

Challenging conventional paradigms, we delve into biosocial theory and explore how biological and social phenomena intersect across species boundaries.

The themes **microbial life**, **antimicrobial resistance**, and **micropollutants** will deepen our understanding of these dynamics. This interdisciplinary dialogue among invited scholars will embrace new perspectives on the complex relationships that shape our world.

A limited number of places are available based on registration at:
